### 3 说明

德州仪器 (TI) bq27621-G1 是一款易于配置的微控制器外设, 此外设提供针对单节锂离子电池的系统侧电量计量。此器件要求最小用户配置和系统微控制器固件开发。

bq27621-G1 使用动态电压关联算法实现电量计量。这一过程在计算剩余电量 (mAh), 充电状态 (%), 电池电压 (mV) 和温度 (°C) 时无需感测电阻器。

使用 bq27621-G1 进行电池电量计量只需将 PACK+ (P+) 与 PACK- (P-) 连接至可拆卸电池组或嵌入式电池电路。微型 9 引脚, 1.62mm x 1.58mm, 0.5mm 焊球间距 YZF 封装非常适合于空间受限应用。

## 6 Pin Configurations and Functions

### Pin Functions

PIN		TYPE <sup>(1)</sup>	DESCRIPTION
NAME	NO.		
BAT	C2, C3	PI, AI	LDO regulator input and battery voltage input. Connect to positive battery connector. For highest accuracy, use a Kelvin connection by directly routing to the PACK+ pin and minimizing current flow through the trace.
BIN	B1	DI	Battery insertion detection input. If <b>Operation Configuration</b> bit [BIE] = 1 (default), a logic low on the pin is detected as battery insertion. For a removable pack, the BIN pin can be connected to V <sub>SS</sub> through a pulldown resistor on the pack, typically the 10-kΩ thermistor; the system board should use a 1.8-MΩ pullup resistor to V <sub>DD</sub> to ensure the BIN pin is high when a battery is removed. If the battery is embedded in the system, it is recommended to leave [BIE] = 1 and use a 10-kΩ pulldown resistor from BIN to V <sub>SS</sub> . If [BIE] = 0, then the host must inform the gauge of battery insertion and removal with the <b>BAT_INSERT</b> and <b>BAT_REMOVE</b> subcommands. A 10-kΩ pulldown resistor should be placed between BIN and V <sub>SS</sub> , even if this pin is unused. <b>NOTE:</b> The BIN pin must not be shorted directly to V <sub>CC</sub> or V <sub>SS</sub> and any pullup resistor on the BIN pin must be connected only to the bq27621 V <sub>DD</sub> and not an external voltage rail.
GPOUT	A1	DO	This open-drain output can be configured to indicate BAT_LOW when the <b>Operation Configuration</b> [BATLOWEN] bit is set. By default [BATLOWEN] is cleared and this pin performs an interrupt function (SOC_INT) by pulsing for specific events, such as a change in State of Charge. Signal polarity for these functions is controlled by the [GPIOPOL] configuration bit. This pin should not be left floating, even if unused, so a 10-kΩ pullup resistor is recommended.
SCL	A3	DIO	Slave I <sup>2</sup> C serial communications clock input line for communication with system (Master). Use with 10-kΩ pullup resistor (typical).
SDA	A2	DIO	Slave I <sup>2</sup> C serial communications data line for communication with system (Master). Open-drain I/O. Use with 10-kΩ pullup resistor (typical).
VDD	B3	PO	1.8-V Regulator Output. Decouple with 0.47-μF ceramic capacitor to V <sub>SS</sub> .

- (1) IO = Digital input-output, IA = Analog input, P = Power connection

**Pin Functions (continued)**

PIN		TYPE <sup>(1)</sup>	DESCRIPTION
NAME	NO.		
VSS	B2, C1	PI	Ground pins. B2 is the actual device ground pin while C1 is floating internally. Therefore, C1 may be used as a bridge to connect to the board ground plane without requiring a via under the device package. Recommend routing B2 to C1 using a top-layer metal trace on the board. Connect to negative battery connector. For highest accuracy, use a Kelvin connection by directly routing to the PACK— pin and minimizing current flow through the trace.

## 8 Detailed Description

### 8.1 Overview

The bq27621-G1 battery fuel gauge accurately predicts the battery capacity and other operational characteristics of a single Li-based rechargeable cell. It can be interrogated by a system processor to provide cell information such as ***State of Charge*** (%) and ***Remaining Capacity*** (mAh). The device is preconfigured with three battery profiles. The default profile is for standard LiCoO<sub>2</sub>-based batteries with a maximum charge voltage of 4.2 V. The other two profiles that can be selected via I<sup>2</sup>C commands are for batteries with charging voltages of 4.3 V and 4.35 V.

Unlike some other fuel gauges, the bq27621-G1 fuel gauge can not be programmed with specific battery chemistry profiles. For many battery types and applications, the predefined standard chemistry profiles available in the bq27621-G1 fuel gauge are sufficient matches from a gauging perspective.

Information is accessed through a series of commands, called *Standard Commands*. Further capabilities are provided by the additional *Extended Commands* set. Both sets of commands, indicated by the general format *Command( )*, are used to read and write information contained within the control and status registers, as well as its data locations. Commands are sent from system to gauge using the I<sup>2</sup>C serial communications engine, and can be executed during application development, system manufacture, or end-equipment operation.

The key to the fuel gauging prediction of the bq27621-G1 fuel gauge is Texas Instruments proprietary Dynamic Voltage Correlation algorithm. This algorithm eliminates the need for a sense resistor when calculating remaining battery capacity (mAh) and state-of-charge (%). This algorithm uses cell voltage measurements and cell characteristics to create state-of-charge predictions that can achieve high accuracy across a wide variety of operating conditions.

The fuel gauge estimates charge and discharge activity by monitoring the cell voltage. Cell impedance is computed based on estimated current, open-circuit voltage (OCV), and cell voltage under loaded conditions.

The fuel gauge uses an integrated temperature sensor for estimating cell temperature. Alternatively, the system processor can provide temperature data for the fuel gauge.

To minimize power consumption, the fuel gauge has several power modes: INITIALIZATION, NORMAL, SLEEP, HIBERNATE, and SHUTDOWN. The fuel gauge passes automatically between these modes, depending upon the occurrence of specific events, though a system processor can initiate some of these modes directly.

The gauge can be configured and used in a matter of minutes by following the *Quickstart Guide for bq27621-G1 (SLUUAP5)*. The information in that document is sufficient for most applications. For further customization and options, more exhaustive details can be found in the *bq27621-G1 Technical Reference Manual (SLUUAD4)*.

## 8.2 Feature Description

### 8.2.1 Data Commands

#### 8.2.1.1 Standard Data Commands

The bq27621-G1 uses a series of 2-byte standard commands to enable system reading and writing of battery information. Each standard command has an associated command-code pair, as indicated in [Table 1](#). Because each command consists of two bytes of data, two consecutive I<sup>2</sup>C transmissions must be executed both to initiate the command function, and to read or write the corresponding two bytes of data. Additional details are found in the [bq27621-G1 Technical Reference Manual \(SLUUAD4\)](#).

**NOTE**

Data values read by the host may be invalid during initialization for a period of up to 3 seconds.

**Table 1. Standard Commands**

### 8.2.1.2 *Control( )*: 0x00 and 0x01

Issuing a *Control( )* command requires a subsequent 2-byte subcommand. These additional bytes specify the particular control function desired. The *Control( )* command allows the system to control specific features of the fuel gauge during normal operation and additional features when the device is in different access modes. Additional details are found in the [bq27621-G1 Technical Reference Manual \(SLUUAD4\)](#).

### 8.2.2 Alternate Chemistry Selection

The fuel gauge allows the user to change the chemistry settings using I<sup>2</sup>C commands. The default chemistry has a CHEM\_ID of 0x1202. The two other CHEM\_IDs supported by this device includes CHEM\_ID 0x1210 and CHEM\_ID 0x354. The detailed procedure to change the chemistry is available in the [bq27621-G1 Technical Reference Manual \(SLUUAD4\)](#).

### 8.2.3 I<sup>2</sup>C Interface

The bq27621-G1 fuel gauge supports the standard I<sup>2</sup>C read, incremental read, quick read, one-byte write, and incremental write functions. The 7-bit device address (ADDR) is the most significant 7 bits of the hex address and is fixed as 1010101. The first 8 bits of the I<sup>2</sup>C protocol are, therefore, 0xAA or 0xAB for write or read, respectively.

Host generated     Gauge generated

(a) 1-byte write

(b) quick read

(c) 1-byte read

(d) incremental read

(e) incremental write

(S = Start, Sr = Repeated Start, A = Acknowledge, N = No Acknowledge, and P = Stop).

The quick read returns data at the address indicated by the address pointer. The address pointer, a register internal to the I<sup>2</sup>C communication engine, increments whenever data is acknowledged by the fuel gauge or the I<sup>2</sup>C master. The quick writes function in the same manner and are a convenient means of sending multiple bytes to consecutive command locations (such as two-byte commands that require two bytes of data).

The following command sequences are not supported:

Attempt to write a read-only address (NACK after data sent by master):

Attempt to read an address above 0x6B (NACK command):

#### 8.2.4 I<sup>2</sup>C Time Out

The I<sup>2</sup>C engine releases both SDA and SCL if the I<sup>2</sup>C bus is held low for 2 seconds. If the fuel gauge is holding the lines, releasing them frees them for the master to drive the lines.

### 8.2.5 I<sup>2</sup>C Command Waiting Time

To ensure proper operation at 400 kHz, a  $t_{(BUF)} \geq 66 \mu s$  bus-free waiting time must be inserted between all packets addressed to the fuel gauge. In addition, if the SCL clock frequency ( $f_{SCL}$ ) is > 100 kHz, use individual 1-byte write commands for proper data flow control. The following diagram shows the standard waiting time required between issuing the control subcommand the reading the status result. For read-write standard command, a minimum of 2 seconds is required to get the result updated. For read-only standard commands, there is no waiting time required, but the host must not issue any standard command more than two times per second. Otherwise, the gauge could result in a reset issue due to the expiration of the watchdog timer.

Waiting time inserted between two 1-byte write packets for a subcommand and reading results  
(required for  $100 \text{ kHz} < f_{SCL} \leq 400 \text{ kHz}$ )

Waiting time inserted between incremental 2-byte write packet for a subcommand and reading results  
(acceptable for  $f_{SCL} \leq 100 \text{ kHz}$ )

Waiting time inserted after incremental read

### 8.2.6 I<sup>2</sup>C Clock Stretching

A clock stretch of up to 4 ms can occur during all modes of fuel gauge operation. In SLEEP and HIBERNATE modes, a short clock stretch occurs on all I<sup>2</sup>C traffic as the device must wake-up to process the packet. In the other modes (INITIALIZATION, NORMAL) clock stretching only occurs for packets addressed for the fuel gauge. The majority of clock stretch periods are small as the I<sup>2</sup>C interface performs normal data flow control.

### 9.2 Trademarks

All trademarks are the property of their respective owners.

### 9.3 Electrostatic Discharge Caution

 This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

 ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.
