Panasonic Relay Technology
Innovation across the board.

Telecommunications, machine construction, measurement and control systems, automotive electronics, building security and installation – today there is virtually no branch of human activity that can exist without using modern relays. Panasonic Electric Works is able to meet both simple or complex demands from its vast range of sophisticated, economic switching technologies by offering the relay most appropriate to solving the specific application.

With over 30 years experience at the forefront of relay innovation and development, Panasonic today offers one of the world`s most comprehensive ranges of electro-mechanical and semiconductor types. Currently our product range extends from ultra-miniature SMD semiconductor types to robust, compact industrial devices. Load switching capability ranges from low-level signals to double-digit ampere values. Panasonic relays are available for all common mounting configurations with screw, PCB, solder or surface mount terminals to meet most demands of operating environments or conditions.

With its well established, comprehensive T and G series relays, we are making significant contributions within the field of global data transmission.

Panasonic power relays, particularly those of the J, L and C series, are not only used in mains isolation applications, but also in diverse ranges of consumer appliances, automotive electrics and diverse OEM manufacturing industries.

In the field of safety of man and machine, the SF-series relays, with forcibly guided contacts, have set a new standard of security.

Panasonic has developed a wide range of SMD miniature relays for the new generation of surface mounting, automated assembly processes. In addition to electromechanical SMD types such as TQ, TX, GN, GQ and CP series, we have made significant developments in the rapidly expanding field of SSR and PhotoMOS relays.

If your application requires long lifetime, stable behavior, small size or high switching speed, semiconductor relays are definitely the best choice for you. Within our broad product range, you can find relays to switch low level loads or double-digit ampere values. Various package options are also available. In other words, our semiconductor relays complement our electromechanical relay selection to allow us to exactly meet your needs.

For us, supplying quality products is paramount. To guarantee superior quality, the company has implemented strict testing and inspection procedures to comply with or even exceed most international specifications. Of course, we have ISO9001 certification.

If you need more detailed information about Panasonic relays, please ask us to send you the complete relay catalog.

Soldering Guidelines for Lead-Free Solder

Our products support lead-free soldering processes. Please contact a Panasonic sales office to find out when each relay will support lead-free solder.

If you are using Sn-Pb eutectic solder, mounting conditions can remain as they are.

When using lead-free solder for our products, please adhere to the following soldering guidelines:

- DIP type

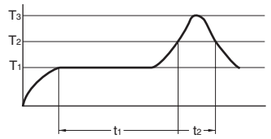
The conditions for mounting with lead-free solder are: preheating at 120°C within 120 seconds and soldering at 260 ±5°C within 6 seconds. (Soldering of PhotoMOS relays can be carried out at 260°C within 10 seconds.)

The reliability of the solder at the joining part can vary greatly depending on the actual mounting conditions. Influencing factors are: the type of lead-free solder, the landshape of the PCB, the mounting conditions.

- SMT type

We recommend the following temperature profile as a condition for automatic mounting when using lead-free solder.

- Recommended temperature profile condition during reflow soldering



T_1 = 150° to 180°C
T_2 = 230°C and higher
T_3 = Up to 250°C

t_1 = 60 to 120 sec.
t_2 = Within 30 sec.

- Cautions when mounting

The relay temperature may rise depending on the mounting density and the heating method of the reflow oven. Accordingly, please set the temperature so that the soldered parts of the relay terminals do not exceed the mounting conditions given above. We recommend checking the temperature rise at each part to be soldered under the actual conditions.

About the Selector Chart

This selector chart is designed to help you quickly select a relay best suited for your needs. Please note: the values given for switching current and switching voltage do not necessarily indicate standard operating conditions. For the nominal switching capacity and other critical values, please refer to the respective data sheet. In case of doubt, please contact your Panasonic representative.

Type ★ = Popular Type (Picture scale: DIN A4)	Features	Switching current	Max. switching voltage	Contact arrangement	Coil voltage
★**GN (SMD)** 1:1  10.6 x 5.7 x 9.0mm	• Compact slim body saves space • Outstanding surge resistance • The use of twin crossbar contacts ensures high contact reliability • RoHS compliant	**Max.:** 1A **Min.:** 10µA 	• 110V DC • 125V AC	2c	(DC) 1.5, 3, 4.5, 6, 9, 12, 24V
★**GQ (SMD)** 1:1  10.6 x 7.2 x 5.2/5.4mm	• Compact flat body saves space • Outstanding surge resistance • The use of twin crossbar contacts ensures high contact reliability • RoHS compliant	**Max.:** 1A **Min.:** 10µA 	• 110V DC • 125V AC	2c	(DC) 1.5, 3, 4.5, 6, 9, 12, 24V
★**TQ** 1:1  14 x 9 x 5mm	• 1,500V FCC 4-pole model available • RoHS compliant	**Max.:** 1A **Min.:** 10µA 	• 110V DC • 125V AC	2c, 4c	(DC) 3, 4.5, 5, 6, 9, 12, 24, 48V
★**TQ (SMD)** 1:1  14 x 9 x 5.6mm	• Ultra low profile 5.8mm • Surge withstand 2,500V • 3 types of surface-mount terminals available • RoHS compliant	**Max.:** 2A **Min.:** 10µA 	• 220V DC • 125V AC	2c	(DC) 1.5, 3, 4.5, 5, 6, 9, 12, 24, 48V

Coil power	Breakdown voltage: Between open contacts	Breakdown voltage: Between contact sets	Breakdown voltage: Contacts to coil	Surge withstand voltage	Mounting method (bottom view)	Approvals Data sheet

Panasonic Electric Works offers a wide range of PhotoMOS relays for use in telecommunication, measurement, security devices and industrial control. Obviously, the PhotoMOS relay differs from the conventional electromechanical relay, but it also distinguishes itself from other switching solutions that utilize optocouplers or semiconductors.

The construction of the PhotoMOS relay is illustrated in Figure 1. The input pins are connected to a light emitting diode. This LED is located on the upper part of the relay and as soon as a current flows through it, it starts emitting infrared light. Below the LED, there is an array of solar cells intergrated into an optoelectronic device, thus switching the output transistors.

The light emitter and detector are moulded in translucent resin that allows light to pass through but provides a dielectric barrier between the input and output side. By integrating an internal circuit in the optoelectronic device, it serves as a control circuit for switching the power MOSFETs and therefore the load circuit in an ON of OFF-state.

A single power MOSFET is only capable of switching a DC voltage since its internal source-drain diode will become forward biased if the load polarity is reversed. Using a PhotoMOS relay for switching AC voltages therefore requires two source-coupled power MOSFETs in one PhotoMOS relay. By connecting the two output transistors of an AC relay in parallel, the allowable DC current can also be increased (A,B or C connection, see Figure 3 and 4).

Basically, the power MOSFET's output acts as a pure ohmic resistance thus distinguishing the PhotoMOS from an optocoupler or triac solution, since no saturation voltage or offset voltage is required. However the aforementioned source-drain diode of the MOSFET may influence the linearity of the output, and the output capacitance may limit the usability for higher frequencies. This strongly depends on the type of PhotoMOS relay used and on the application's requirements. Due to Panasonic Electric Works' broad product range, we are able to offer PhotoMOS relays for numerous applications, enabling you to utilize PhotoMOS' advantages:

- Low control current
- Control of small analog signals
- Low leakage current
- Fast switching speed
- Stable ON-resistance over lifetime
- Extremely long product life
- Small size
- Flexible mounting position
- High vibration and shock resistance
- No contact bouncing
- No switching noise

Due to the enormous variety of PhotoMOS relays, they are suitable for numerous applications. They can be used in telecommunications and for measurement equipment, for switching and controlling small motors or other power loads, and for controlling various signals out of microcontrollers.

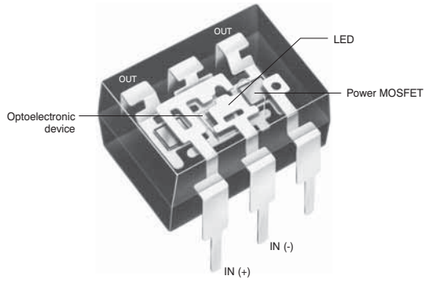

Figure 1: PhotoMOS internal construction

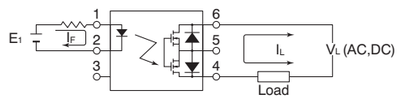

Figure 3: PhotoMOS in A connection

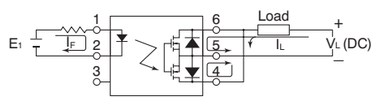

Figure 4: PhotoMOS in C connection

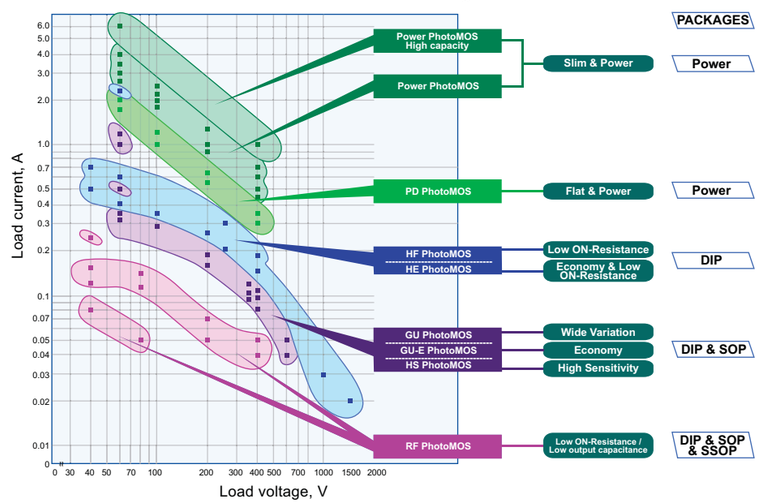

Figure 2: PhotoMOS load current vs. voltage - Selector Chart

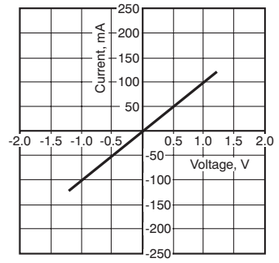
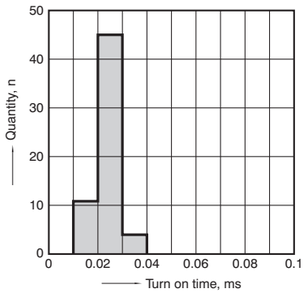
Examples of PhotoMOS Advantages

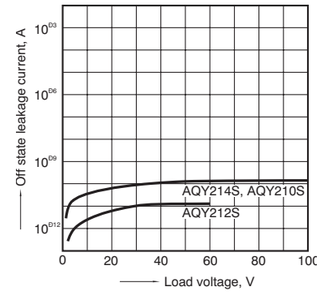
1. High output linearity without any saturation or offset voltage making PhotoMOS perfectly suitable for switching signals or loads (AQY225R2V).



2. Fast switching times with stable behavior over lifetime and no contact bouncing due to semiconductor technology (AQY221N3V).



3. Perfectly suited for switching low level signals due to low off-state leakage current in the range of pA to nA (AQY21*S).



4. PhotoMOS relays require very low input control currents. Sensitive types are also available (AQV234). Take temperature and safety considerations into account.
