SGM8749
150ns, 3V/5V, Single-Supply, Low Power, Rail-to-Rail Input Comparator

GENERAL DESCRIPTION

The SGM8749 is a single, high speed, low power comparator, which features a fast 150ns propagation delay. The device is optimized for low voltage operation on 3V or 5V supply, and consumes only 22μA supply current.

The SGM8749 supports rail-to-rail input operation. The input common mode voltage range is from -0.1V to V_{CC} + 0.1V. The device has an open-drain output structure that needs external pull-up resistor. Any input or output pin has a continuous short-circuit protection to both power supply rails.

The SGM8749 is available in Green SOT-23-5 and SC70-5 packages. It is rated over the -40℃ to +85℃ temperature range.

FEATURES

- **Low Propagation Delay: 150ns (Overdrive = 10mV)**
- **Low Supply Current: 22μA (TYP) at V_{CC} = 3V**
- **Low Offset Voltage: 0.8mV (TYP)**
- **Rail-to-Rail Input**
- **Supply Voltage Range: 2.7V to 5.5V**
- **Optimized for 3V and 5V Applications**
- **Open-Drain Output**
- **Output Swing with 4mA Output Current: 185mV (TYP)**
- **Supports CMOS or TTL Logic**
- **-40℃ to +85℃ Operating Temperature Range**
- **Available in Green SOT-23-5 and SC70-5 Packages**

APPLICATIONS

3V or 5V Applications
Portable/Battery-Powered Equipment
Mobile Phones
Zero-Crossing Detectors
Threshold Detectors
Line Receiver Units

OVERSTRESS CAUTION

Stresses beyond those listed in Absolute Maximum Ratings may cause permanent damage to the device. Exposure to absolute maximum rating conditions for extended periods may affect reliability. Functional operation of the device at any conditions beyond those indicated in the Recommended Operating Conditions section is not implied.

ESD SENSITIVITY CAUTION

This integrated circuit can be damaged if ESD protections are not considered carefully. SGMICRO recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage. ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because even small parametric changes could cause the device not to meet the published specifications.

NOTES:

1. This value is from PSRR test.
2. This value is from PD test. For the range of common mode voltage, the maximum input common mode voltage can reach V_{CC} + 0.1V without any damage to SGM8749.
3. CMRR is defined over the condition of whole input common mode range.

DETAILED DESCRIPTION

The SGM8749 is a single, high speed, low power comparator optimized for low voltage operation from 2.7V to 5.5V single supply. The device supports rail-to-rail input operation. It is suitable for portable equipment. Open-drain structure needs external pull-up resistor. The SGM8749 can be compatible with CMOS and TTL logics.

Output Structure

In Figure 1, the SGM8749 has an open-drain output stage. When output is changed from logic high to low, the changed sink current pulls output pin to logic low. Beginning this transition, larger sink current is used to create a high slew rate transit from high to low. Once the output voltage reaches V_{OL}, it will reduce the sink current to a just right value to maintain the V_{OL} static condition. This current-driven open-drain output stage will significantly reduce the power consumption in application system.

If low slew rate transition is needed in system design, adjusting the load capacitance will change the slew rate. The heavier capacitive load will slow down the output voltage transition. This feature will be used to reduce the interference generated by fast edge of transition between 1 and 0 in noise-sensitive system.

Layout and Bypassing

Good power supply decoupling, layout and grounding are very important for SGM8749 to realize the full high-speed capabilities in system, following skills will be used:

◆ A 0.1μF to 4.7μF range ceramic capacitor is used to provide good power supply decoupling. This ceramic capacitor must be placed as close to V_{CC} pin as possible.

◆ For grounding, unbroken and low-inductance ground plane is a good choice.

◆ For Layout, use short PCB trace to avoid unwanted parasitic feedback around the comparator. SGM8749 must be soldered directly to the PCB and the socket is not recommended.
